

Photon: Real-Time WebSocket Ticker (Simple Python Example)

This is a **basic and beginner-friendly** Python example showing how a real-time WebSocket ticker works. You can adapt the URL and message format according to Photon API documentation provided by your broker or company.

```
# Install required library
# pip install websocket-client

import websocket
import json

# WebSocket URL (replace with actual Photon WebSocket URL)
WS_URL = "wss://example.photonapi.com/realtime"

def on_open(ws):
    print("WebSocket connection opened")

    # Example subscription message
    subscribe_message = {
        "action": "subscribe",
        "symbols": ["NIFTY", "BANKNIFTY"]
    }

    ws.send(json.dumps(subscribe_message))

def on_message(ws, message):
    data = json.loads(message)
    print("Live Tick Data:", data)

def on_error(ws, error):
    print("Error:", error)

def on_close(ws):
    print("WebSocket connection closed")

if __name__ == "__main__":
    ws = websocket.WebSocketApp(
        WS_URL,
        on_open=on_open,
        on_message=on_message,
        on_error=on_error,
        on_close=on_close
    )

    ws.run_forever()
```

How this works:

1. Connects to a WebSocket server.
2. Subscribes to symbols (like stocks or indices).
3. Receives live tick data continuously.
4. Prints data in real time.
